

- Pro-active monitoring with data aggregation and analysis on telemetry data.
- Fault Identification by detection of field events, real time and historic data dashboards showing marker trends.
- RDK-based Micronets providing traffic segmentation and policy management in a home network using SDN.
- Content Management System integrated with Customizable Lightning based Prime Application framework on RDK platform.

Highlights

- Monitor device health markers including memory usage, load average, known error strings, program id etc
- Enable proactive measures to improve user experience before incident reporting.
- Provide differentiated services for the various sub networks, enable specific features like bandwidth control, parental control, additional security etc
- Reduce time to market for new application release
